

Setting up Pop3 email on an iPhone

Access your Settings button from the iPhone home screen

Go ahead and click "Add Account" Which brings us to the next page

Click Other and then add mail account.

Here you'll enter in your basic account credentials: Your name, your full email address, and your POP3 password. Once you've gotten that in hit save.

Be sure to select the POP setting at the top, commonly IMAP is the default setting for a new account on the iPhone.

Now you need to tell your iPhone what server you're going to be operating on.
For the Incoming Mail Server information you'll want to place:
mail.yourdomainname.com
Username: username@yourdomain.com
Password: your_pop3_password

Outgoing Server

For the Outgoing server settings:

Outbound server: mail.yourdomainname.com

Username: username@yourdomain.com

Password: [your_pop3_password](#)

Configure Ports

Now we need to configure the ports for your servers, so let's get back into the Mail Settings and click on our New account. First off let's go to the Outgoing Mail server, click on the SMTP option and click on the Primary server which should be mail.yourdomainname.com

Here's where you'll need to make a few small changes, we need to turn **SSL off** and use the **Port number of 587**. Once you've done that you can back out to previous screen for the next step.

Now we need to configure the Incoming Mail Port. Click on the advanced button and you should be brought to this screen.

The Default should be SSL on with Port 995 but you can also set this to **SSL off** with **port 110** if you wanted to.

That should take of everything now! Now back out to your home screen and access your mail app.
